

Set up the secure browser on your Mac

Your student will log into a **secure browser** for the required ILEARN Checkpoint in October. Check your Mac and install it now, so test day starts smoothly.

We don't recommend Chromebooks. They aren't compatible with the secure browser's device requirements unless a school system has specifically set them up and manages them.

1 Check which version of macOS you have

1. Click the apple-shaped **Apple menu** in the top left corner of your screen.
2. Click **About This Mac**. The window that opens lists your version near the bottom.

Look for the line labeled **macOS**.

You're set

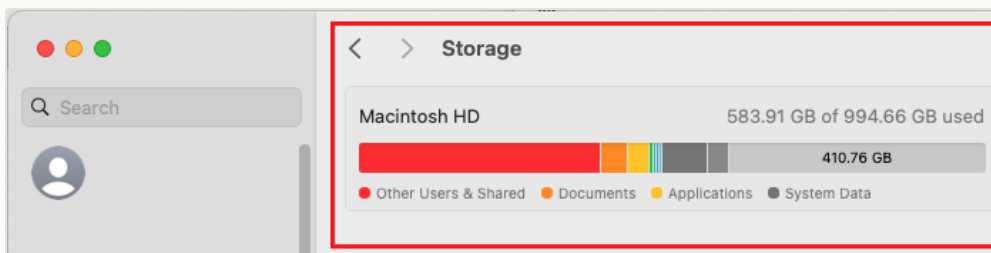

Your version ends in **14.6, 15, 26, or 27**.

Update first

Anything else. Check your Mac for available updates, then look again.

2 Check that you have 20 GB or more of free space

1. Click the **Apple menu** again, then **System Settings**.
2. Click **General**, then **Storage**.
3. Read how much space is left.

The bar shows what's used and what's still free.

You're set

20 GB or more of free space.

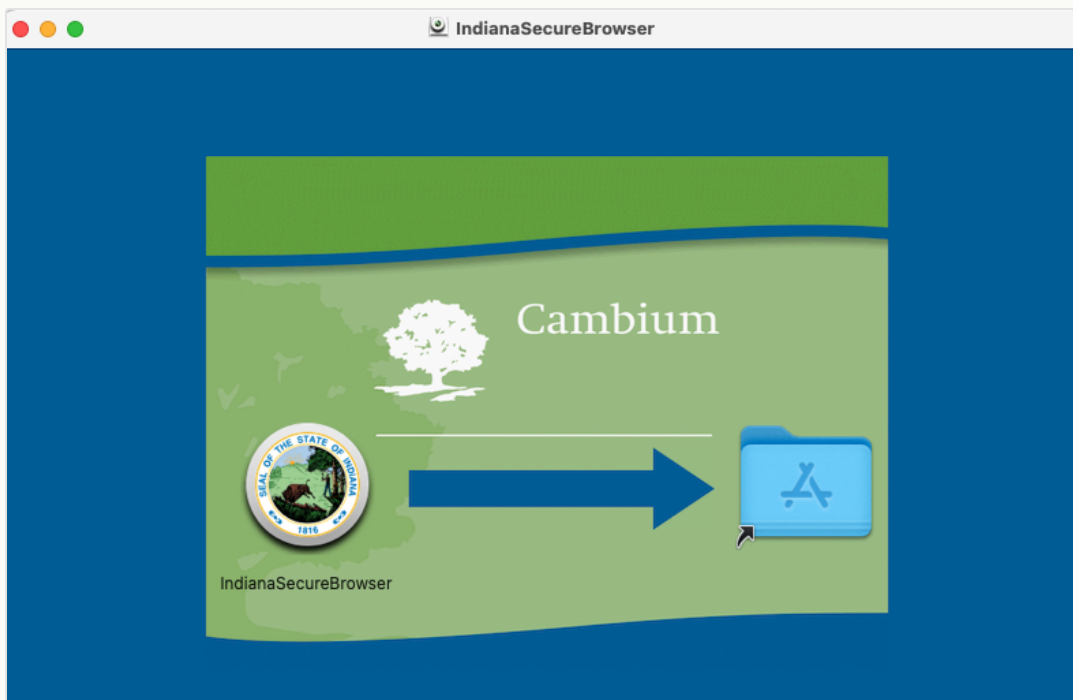

Clear some room

Less than 20 GB. Delete files you no longer need, then check again.

3

Download and install the secure browser

1. Go to the [Indiana secure browser page](#), then click the **macOS** tab on the left side of the screen.
2. Click **Download Secure Browser**.
3. Open your **Downloads** folder and click the file you just downloaded.
4. A window like the one below will open. Drag the **IndianaSecureBrowser** icon onto the blue folder icon beside it, following the arrow.

Drag from left to right.

That's everything. Leave the browser installed — your student will use it on Checkpoint day.
